

Apex Systems — Proposal for Cloud-Based Order Management System

Submitted to: Procurement Committee | **Date:** July 10, 2026

1. Executive Summary

This proposal responds to the RFP issued by a mid-size retail group seeking a cloud-based Order Management System (OMS) to consolidate order processing across e-commerce, in-store point-of-sale, and wholesale channels. The system must integrate with the client's existing SAP ERP and warehouse management system, provide real-time inventory visibility across channels, and support approximately 3x order-volume growth over the next 24 months without a re-platform. Apex Systems proposes a microservices-based OMS built on a Kubernetes-native architecture, designed from the ground up for the scale, auditability, and security posture that a growing multi-channel retailer requires. Our approach prioritizes a technically rigorous foundation over the fastest possible delivery, on the view that re-architecting a hastily built OMS in 18 months is more expensive than building it correctly the first time.

2. Proposed Solution & Implementation Approach

Our OMS is composed of independently scalable services (order capture, inventory ledger, fulfillment routing, returns) communicating via an event bus (Kafka), which allows each channel's peak load to be isolated. Integration with the client's SAP ERP uses SAP's certified OData and IDoc connectors, with a dedicated reconciliation service that reports integration drift daily rather than relying on manual spot-checks.

- Event-driven architecture with Kafka for channel isolation and horizontal scaling
- Certified SAP OData/IDoc connectors with automated daily reconciliation reporting
- Multi-region active-passive deployment on AWS (primary: us-east-1, DR: us-west-2)
- Load-tested to 3.5x current peak order volume in a staging environment prior to go-live

3. Timeline, Team Structure & Milestones

We propose a 7-month implementation, phased to de-risk the SAP integration before cutting over any single channel.

- Month 1: Discovery, environment provisioning, SAP interface design workshop
- Months 2-3: Core OMS build + SAP integration in a sandbox environment
- Month 4: E-commerce channel pilot (10% of order volume)
- Month 5: POS and wholesale channel integration
- Month 6: Full-volume load testing and security review
- Month 7: Phased cutover and hypercare (3 weeks of dedicated on-call support)

Team: 1 Engagement Lead, 1 Solutions Architect, 4 backend engineers, 1 SAP integration specialist, 1 QA/security engineer, and 1 Delivery Manager (part-time), all dedicated for the duration of the engagement.

4. Pricing

Line Item	Detail	Price (USD)
Implementation (fixed bid)	Discovery through go-live, 7 months	\$412,000
SAP Integration Add-on	Custom OData/IDoc reconciliation service	\$58,000
Annual Platform License	Per-tenant SaaS license, Year 1	\$96,000 / yr
Hypercare Support	3 weeks post-go-live, dedicated on-call	Included
Ongoing Support (Yr 2+)	Business-hours SLA, 4-hour response	\$8,000 / mo

Assumptions: Pricing assumes client provides SAP sandbox access by Month 1, a single primary AWS account, and up to 15 concurrent integration test cycles. Additional custom connectors beyond SAP are quoted separately. Total Year 1 cost including license: approximately \$566,000.

5. Security, Compliance & Risk Controls

Security is a first-class design constraint, not a post-implementation add-on.

- SOC 2 Type II certified hosting environment (audit report available under NDA)
- PCI DSS Level 1 compliant handling of any payment-adjacent order data
- Field-level encryption at rest (AES-256) and TLS 1.3 in transit for all order data
- Role-based access control (RBAC) with full audit logging retained for 7 years
- Third-party penetration test conducted quarterly; last report dated March 2026
- Documented incident response plan with a 1-hour client notification SLA for P1 events

Key risk: SAP integration complexity is the primary schedule risk on OMS projects generally. We mitigate this by front-loading SAP interface design into Month 1 rather than treating it as a late-stage integration task.

6. Support Model, Experience & References

Apex Systems has delivered 11 OMS or order-orchestration implementations in the past five years for retail and consumer-goods clients, 6 of which involved SAP ERP integration of comparable scope.

- Reference 1: Regional home-goods retailer (~\$400M revenue) — SAP-integrated OMS, live since 2023, handling 2.1x original peak volume without incident
- Reference 2: Specialty apparel retailer — multi-channel OMS with WMS integration, live since 2022
- Post-go-live support: business-hours SLA standard, 24/7 SLA available at \$14,000/mo
